

Conclusion

There will be 20.4 billion Internet of Things (IoT) devices to be deployed by 2020, according to analyst firm Gartner. Devices such as TVs, fridges, and security cameras, is expected to grow 31 percent this year to reach 8.4 billion devices, or around a billion more than the world's total population. That figure compares with last year's total installed base of 6.38 billion devices. The IoT will lead the market in coming years and the cyber security must be prepared for well in advance.
